

Awareness Program

Extempore and Essay Writing Competition on Water Conservation in Zilla Parishad High School,

Peddapur village

9th February, 2016

SaciWATERs in joint partnership with HMWSSB, Hyderabad Metropolitan Water Supply and Sewerage Board conducted an awareness program on “Sustainable Water Conservation techniques” in ZPHS, Zilla Parishad High School, Peddapur village, Telangana on 9th February, 2016. The programme was a part of a series of awareness programs that SaciWATERs is undertaking in collaboration with the Government of Telangana. This series is being funded by Arghyam and co-funded by NWO, the Netherlands Organization for Scientific Research.

Peddapur village is part of Medak district, one of the severely drought hit districts of Telangana. An ongoing research of SaciWATERs has revealed that this village is highly dependent on agriculture, while many other surrounding peri-urban villages have diversified their livelihood activities. The extreme climatic conditions coupled with heavy extraction of water for commercial farming has resulted in disappearance of all the surface water bodies and a steep fall in the ground water table. This finding has also been confirmed by the Ground Water Board. It was felt that an awareness programme on water conservation and importance of rainwater harvesting will help the community to understand the importance of harnessing rainwater and to sustainably use their limited water resources.

ZPHS is the only public school in the village. The school has strength of 250 students. The event was organized for the students of class 9 and 10. While class 9 students participated in extempore competition, essay-writing competition was organized for class 10. All the 80 students were present during the event; however some students did not take part in the extempore.

For the essay writing competition the students were given 2 hours to write on the theme ‘Importance of rainwater harvesting’. The essays were evaluated by a team of experts from SaciWATERs. In their writing students used diagrams and illustrations depicting different techniques of rainwater harvesting and laid emphasis on traditional techniques of water harvesting and conservation such as farm ponds, soak pits, check dams, masonry dams, and dead furrows in farm lands.

During the extempore students were given different themes related to water conservation and sustainable farming techniques. Some students spoke in detail about organic farming and indigenous water conservation techniques that can be used in their village. The level of enthusiasm was high in extempore, however some students did not participate due to stage fear and lack of speaking exposure.

The top three performers were awarded with informative books and all the other participants were awarded certificates. After the event SaciWATERs team felt that this kind of awareness programme would be more effective if it is in the written form. The idea of providing students some reading material prior to the event can be explored. Developing manuals for this purpose can be useful.
